SCOPE OF AGRÉMENT

This Agrément relates to Beamshield Top Sheet/UFH and Beamshield Plus Top Sheet/UFH flooring insulation systems (hereinafter the 'Systems'). The Systems are for use as thermal insulation in suspended ground floors in domestic, residential and commercial buildings.

SYSTEM DESCRIPTION

The Systems comprise Beamshield Infill, Beamshield Plus, Beamshield Top Sheet and Beamshield Variable Width Board (hereinafter 'Beamshield VWB') expanded polystyrene (hereinafter 'EPS') units. The EPS units are available in standard performance (white) or Platinum high performance (grey) versions and are manufactured in accordance with BS EN 15037-4 and BS EN 13163 as applicable. The Systems are used in conjunction with structural concrete toppings, pre-stressed concrete beams and masonry closure and coursing blocks (manufactured by others) in suspended concrete ground floors over a sub-floor void.

SYSTEM ILLUSTRATION

THIRD-PARTY ACCEPTANCE

NHBC - For detailed information see section 3.3 (Third-Party acceptance).

STATEMENT

It is the opinion of Kiwa Ltd., that the Systems are fit for their intended use, provided they are specified, installed and used in accordance with this Agrément.

Chris Vurley, CEng
Technical Manager, Building Products

Mark Crowther, M.A. (Oxon)
Kiwa Ltd. Technical Director

SUMMARY OF AGRÉMENT

This document provides independent information to specifiers, building control personnel, contractors, installers and other construction industry professionals considering the fitness for the intended use of the Systems. This Agrément covers the following:

- Conditions of use;
- Factory Production Control, Quality Management System and the Annual Verification procedure;
- Points of attention for the Specifier and examples of details;
- Installation;
- Independently assessed System characteristics and other information;
- Compliance with national Building Regulations, other regulatory requirements and Third-Party acceptance, as appropriate;
- Sources.

MAJOR POINTS OF ASSESSMENT

Thermal performance - the EPS components used in correctly designed and installed Systems can enable a floor to meet the requirements of the national Building Regulations in respect of U-value performance (see sections 2.1.9 and 2.1.10).

Condensation and water (vapour) infiltration risk - the EPS components used in correctly designed and installed Systems can contribute to suitably controlling the risk of interstitial and surface condensation (see section 2.1.11).

Structural performance - correctly designed and installed Systems will have sufficient strength and rigidity to sustain and transmit both dead and imposed floor loads (see section 2.1.12).

Durability - the EPS components are chemically stable, rot-proof and durable and have a design life equivalent to that of the building in which they are incorporated (see section 2.1.13).

CE marking - the product manufacturers have taken responsibility for CE marking of the products used in the Systems in accordance with all relevant harmonised European Product Standards. An asterisk (*) appearing in this Agrément indicates that data shown is given in the relevant product manufacturer's Declaration of Performance (DoP) (see section 2.1.14).

CONTENTS

Chapter 1 - General considerations

- 1.1 - Conditions of use
- 1.2 - Factory Production Control (FPC) and Quality Management System (QMS)
- 1.3 - Annual verification procedure - continuous surveillance

Chapter 2 - Technical assessment

- 2.1 - Points of attention to the Specifier
- 2.2 - Examples of details
- 2.3 - Installation
- 2.4 - Independently assessed System characteristics
- 2.5 - System components and ancillary items
- 2.6 - Typical installation examples

Chapter 3 - CDM, national Building Regulations and Third-Party acceptance

- 3.1 - The Construction (Design and Management) Regulations 2015 and The Construction (Design and Management) Regulations (Northern Ireland) 2016
- 3.2 - The national Building Regulations
- 3.3 - Third-Party acceptance

Chapter 4 - Sources

Chapter 5 - Amendment history

CHAPTER 1 - GENERAL CONSIDERATIONS

1.1 - CONDITIONS OF USE

1.1.1 Design considerations

See section 2.1.

1.1.2 Application

The assessment of the Systems relates to their use in accordance with this Agrément and the Agrément holder's requirements.

1.1.3 Assessment

Kiwa Ltd. has assessed the Systems in combination with their relevant DoPs, test reports, technical literature and factory and site visits. Also, NHBC Standards have been taken into consideration. Factory Production Control has been assessed.

1.1.4 Installation supervision

The quality of installation and workmanship must be controlled by a competent person who must be an employee of the installation company.

The Systems must be installed strictly in accordance with the instructions of the Agrément holder and the requirements of this Agrément.

1.1.5 Geographical scope

The validity of this document is limited to England, Wales, Scotland and Northern Ireland, with due regard to chapter 3 of this Agrément (CDM, national Building Regulations and Third-Party Acceptance).

1.1.6 Validity

The purpose of this BDA Agrément® is to provide for well-founded confidence to apply the Systems within the Scope described. The validity of this Agrément is three years after the issue date, and as published on www.kiwa.co.uk/bda.

1.2 - FACTORY PRODUCTION CONTROL (FPC) AND QUALITY MANAGEMENT SYSTEM (QMS)

Kiwa Ltd. has determined that the Agrément holder fulfils all obligations in relation to this Agrément, in respect of the Systems.

The initial FPC audit demonstrated that the Agrément holder has a satisfactory Quality Management System (QMS) and is committed to continuously improving their FPC operations.

Document control and record keeping procedures were deemed satisfactory.

A detailed Production Quality Specification (PQS) has been compiled to ensure traceability and compliance under the terms of this Agrément.

1.3 - ANNUAL VERIFICATION PROCEDURE - CONTINUOUS SURVEILLANCE

To demonstrate that the FPC is in conformity with the requirements of the technical specification described in this Agrément, the continuous surveillance, assessment and approval of the FPC will be done at a frequency of not less than once per year by Kiwa Ltd.

This Agrément does not constitute a design guide for the Systems. It is intended as an assessment of fitness for purpose only.

2.1 - POINTS OF ATTENTION TO THE SPECIFIER**2.1.1 Design responsibility**

A Specifier may undertake a project specific design in which case it is recommended that the Specifier co-operates closely with the Agrément holder; the Specifier is responsible for the final project specific design.

2.1.2 Applied building physics (heat, air, moisture)

The physical behaviour of the building incorporating the Systems shall be verified as suitable by a competent specialist, who can be either a qualified employee of the Agrément holder or a qualified consultant. The Specialist will check the physical behaviour of the building design and if necessary, can offer advice in respect of improvements to achieve the final specification. It is recommended that the Specialist co-operates closely with the Agrément holder.

2.1.3 General design considerations

A project specific design will be required and must give due consideration to the composite of the EPS elements (see section 2.1.12.2), the pre-stressed concrete beams (see section 2.1.12.3) and the structural concrete toppings (see section 2.1.12.4).

2.1.4 Project specific design considerations

No pre-installation survey is required for the installation of the Systems - see section 2.3.3.

2.1.5 Permitted applications

Only applications designed according to the specifications as given in this Agrément are allowed under this Agrément, in each case the Specifier will have to co-operate closely with the Agrément holder.

2.1.6 Installer competence level

The Systems must be installed strictly in accordance with the instructions of the Agrément holder and the requirements of this Agrément.

Installation can be undertaken by competent persons experienced in this sort of work.

2.1.7 Delivery, storage and site handling

The Systems are delivered to site in suitable packaging, that bear the System name, the Agrément holder's name, the CE mark and the BDA Agrément® logo incorporating the number of this Agrément.

Store the System components in accordance with the Agrément holder's requirements. Particular care must be taken to:

- stack off the ground (to avoid contamination);
- protect from damage caused by impact or handling;
- avoid exposure to direct sunlight and high or low temperatures for extended periods of time;
- avoid contact with organic solvents;
- store away from possible ignition sources.

2.1.8 Maintenance and repair

Once installed, the Systems do not require maintenance.

Performance factors in relation to the Major Points of Assessment**2.1.9 Thermal performance**

For the purpose of U-value calculations and to determine if the requirements of the national Building Regulations are met, the thermal resistances of the project specific design shall be calculated according to BR 443 and BS EN ISO 10211. The recommendations of the Thermal Bridging Guide should also be observed.

The Agrément holder can provide a service for 2D and 3D calculations for numerically modelled EPS beam and block configurations, complying to BS EN ISO 13370, BS EN ISO 10211 and BR497.

The requirement for limiting heat loss through the building fabric, including the effect of thermal bridging can be satisfied if the U-values of the building elements do not exceed the maximum values in the relevant Elemental Methods given in the national Building Regulations. Further information with respect to national Building Regulations is given in chapter 3 of this Agrément.

2.1.10 Junction linear thermal transmittance (ψ) values

The Agrément holder provides a design service to maximise the benefit of the Systems in improved ψ -values including external walls (perpendicular and parallel), party walls, thresholds and temperature factors. Care must be taken in the overall design and construction of junctions with other elements to minimise thermal bridges and air infiltration. Guidance on linear thermal transmittance, heat flows and surface temperatures can be found in the documents supporting the national Building Regulations and BS EN ISO 10211, BRE Information Paper IP 1/06, BRE Report 262, BRE Report 497 and PAS 2030 - Building Fabric Measures (BFM). Modelling can be undertaken according to BR 497. Consult the Agrément holder for further details.

Default ψ -values are given in SAP 2012.

2.1.11 Condensation risk

Ground floors incorporating correctly designed and installed Systems can limit the risk of interstitial and surface condensation when designed in accordance with BS 5250. A condensation risk analysis must be completed by the Specifier at project specific design stage.

In order to minimise any risk of interstitial condensation, there must always be an underfloor void of at least 150 mm high beneath the lowest point of the floor construction, which incorporates ventilation openings in opposing external walls to facilitate through-ventilation. Any pipes used to carry ventilating air should be a minimum of 100 mm in diameter and ventilation openings should be a minimum of 1500 mm².m⁻¹ of external wall run or 500 mm².m⁻² of the floor area, depending which is the greatest.

When designed and installed in accordance with this Agrément the Systems will contribute to a convection-free envelope of high vapour resistance.

Wall insulation should extend to at least 150 mm beyond the bottom of the beam in order to minimise any risk of interstitial condensation at junctions of floors and external walls.

To minimise the risk of condensation at service penetrations, care must be taken to minimise gaps in the insulation layer, for example by filling with expanding foam insulation.

2.1.12 Structural performance

2.1.12.1 General

A qualified structural engineer must ensure that the Systems are suitable for their intended use, including in the temporary works phase prior to the curing of the structural topping.

Where a partition wall (defined as a blockwork or stud wall) of $\leq 1 \text{ kN}\cdot\text{m}^{-1}$ is required, this can be placed in any orientation across the floor area, subject to the Structural Engineer's project specific design.

Partition walls running parallel to beams must be installed directly above, or within a maximum distance from the supporting beams specified by the Structural Engineer. The Structural Engineer should be consulted to ensure the structural topping and beam/s have suitable strength and stiffness to transfer the partition wall loading to supporting structural elements.

Partition walls perpendicular to beams must be adequately supported.

It is important that Beamshield Top Sheets are not installed with joints within any zone of structural loading or influence. These include (but are not limited to) directly over and parallel to the precast concrete beams, nor within 375 mm of the centreline of a partition spanning perpendicular to the beams.

2.1.12.2 Beamshield EPS units (Beamshield Plus and Beamshield Infill), Beamshield Top Sheets and Beamshield VWB

The Beamshield Plus and Beamshield Infill units in conjunction with Beamshield Top Sheets and Beamshield VWB provide a formwork to the structural concrete topping. Only the Beamshield Top Sheets make a further contribution to the long-term structural performance of the floor in the form of load spreading, once the structural concrete topping has been placed and obtained its' full design strength.

Installation of the Beamshield EPS units requires free movement of beams, this will also assist with fitting multiple beam units and thicker units.

Placing beams in contact with parallel walls must be avoided as this creates a cold bridge.

When using Beamshield Plus units it is good practice to begin each bay with a Beamshield EPS starter unit and proceed installing the units in the direction of the toe and continue to the opposite wall. Change of direction must be avoided as this could lead to gaps in the insulation envelope.

The structural concrete topping over the Beamshield EPS starter and end units shall project no greater than 300 mm and must be designed as a cantilevered slab. Beamshield EPS end units can be cut from full or half units, ensuring that this is done accurately and squarely so they fit closely to the inner leaf of the wall. The Beamshield VWB shall be no greater 350 mm wide.

To reduce the risk of accidental penetration of the System components during the construction phase, spacers for supporting mesh reinforcement should be located on spreader plates over the Beamshield Top Sheets.

2.1.12.3 Precast concrete beams

The structural pre-stressed concrete beams act to transfer load to the supporting primary structure.

The project specific pre-stressed concrete beam configuration must be designed in accordance with BS EN 1992-1-1 by the Structural Engineer to ensure that the beams are adequate to resist the applied loading. It should be ensured that the natural frequency of the beam exceeds 4 Hz and that the response factor of the floor to footfall vibration is in line with design guidance and industry best practice. Due design consideration should be given to vibration from external sources or rhythmic activity.

For the total required pre-stressed concrete beam header width parallel and perpendicular to the partition wall for the top sheets defined in Table 6, see Figures 1 and 2 respectively.

The pre-stressed concrete beams must be CE marked, designed and manufactured to BS EN 15037-1.

Due consideration should be given to BS EN 1992-1-1 when considering the serviceability deflection limit of pre-stressed concrete beams used in the Systems.

Calculations must be made in line with the guidance and requirements of BS EN 1992-1-1 to determine the maximum effective spans of pre-stressed concrete beams (making the assumption that the pre-stressed concrete beams are simply supporting and self-bearing). The minimum bearing width to support the pre-stressed concrete beam should be 90 mm as defined in BS 8103-1.

Where two or more concrete beams are placed side by side (such as under load-bearing walls), the spaces between the beam webs should be filled with a minimum strength class concrete of C25/30.

Figure 1 - Total required pre-stressed concrete beam header width parallel under a partition wall

Figure 2 - Total required pre-stressed concrete beam header width perpendicular to partition walls

2.1.12.4 Structural concrete toppings

Concrete toppings for a project-specific design shall be approved by a Structural Engineer in accordance with the following:

- BS 8500-1;
- BS 8500-2;
- BS EN 206;
- BS EN 1992-1-1;
- MPA British Precast Flooring Federation 'Design Guide for Concrete Toppings to Beam & EPS Block Suspended Floors'.

Concrete toppings shall be manufactured in plants covered by the Quality Scheme for Ready Mixed Concrete (QSRMC) or similar quality scheme and laid by personnel with the appropriate skills and experience.

Due consideration should be given to NHBC Guidance in respect of the use of reinforcement to concrete toppings above beam and block floors where appropriate.

Polymer micro-fibre only reinforced concrete toppings are not accepted on NHBC sites.

Where steel or polymer macro-fibre reinforcement is required by design, suitable products must be specified and used. Consult the Agrément holder for further details.

Steel macro-fibres, if used, should be CE marked in accordance with BS EN 14889-1 and for fresh and hardened concrete their content should be measured in accordance with BS EN 14721.

Polymer macro-fibres, if used, should be CE marked in accordance with BS EN 14889-2 and for fresh and hardened concrete their content should be measured in accordance with BS EN 14488-7.

In all instances, where fibres are used their dosage rates should include 15 % additional fibres above the rate required that suits the design requirements. This makes allowance for the batching process and deviations.

When reinforced with steel mesh the topping shall be designed according to BS EN 1990, BS EN 1991 and BS EN 1992-1-1, with a maximum aggregate size of 20 mm.

The concrete specifications in Table 1 are suitable for single-family self-contained dwelling blocks and communal areas in blocks of flats, using top sheets defined in Table 6 in accordance with the permitted imposed loads defined in Table 3.

Table 1 - Macro-polymer fibre, micro-polymer fibre and steel fibre reinforced self-compacting/standard concrete topping specifications

Fibre Brand		Durus EasyFinish	Durus S400	B&BA Macro	B&BA Steel	Adfil SF86	Fibrin X-T 13-19 mm	Fibrin 23	Fibrin PC 12
Fibre type ⁱ		Macro-fibre			Steel fibre		Micro-fibre		
Fibre material		Polymer			Steel		Monofilament Polypropylene	Polypropylene	
Standard		BS EN 14889-2	BS EN 14889-2	BS EN 14889-2	BS EN 14889-1	BS EN 14889-1	BS EN 14889-2	BS EN 14889-2	BS EN 14889-2
Fibre Class		II	II	II	I	II	la	la	la
Overall thickness above services (mm)		75	75	75	75	75	75	75	65
Minimum Grade		C25/30	C25/30	C28/35	C28/35	C25/30	C25/30	C25/30	C28/35
Maximum aggregate size ⁱⁱ	Self-compacting concrete ⁱⁱⁱ (mm)	10							
	Standard concrete ⁱⁱⁱ (mm)	20							
Dosage (kg·m ⁻³)		3.00 ^{iv}	4.0 ^{iv}	3.84 ^{iv}	17.5 ^{iv}	13.33 ^{iv}	0.91	0.91	0.75

ⁱ steel fibres, macro-fibres and micro-fibres with similar or better characteristics can be used when agreed by both the Agrément holder and Kiwa Ltd.;

ⁱⁱ the aggregate for concrete shall comply with BS EN 12620;

ⁱⁱⁱ the specification and workability of concrete should be selected as appropriate for the intended installation method in accordance with BS 8500-1 and BS EN 206;

^{iv} dosage rates of steel and polymer fibres for concrete include 15 % additional fibres and are designed to give the minimum required residual flexural tensile strength of concrete toppings with steel and macro-polymer fibres including a tolerance for batching and fibre distribution.

The concrete specifications in Table 2 are suitable for single-family self-contained dwelling blocks, communal areas in blocks of flats, and commercial buildings with the permitted imposed loads defined in Table 3.

Table 2 - Self-compacting/standard concrete topping specifications

		Mesh	A142	A142	Steel ⁱ	Steel ⁱ
		Standard	BS 4483	BS 4483	BS 4483	BS 4483
Maximum aggregate size ⁱⁱⁱ	Overall thickness above services (mm)		75	65 ⁱ	75	75
	Grade		C25/30	C28/35	C25/30	C28/35
	Self-compacting concrete (mm) ^{iv}		10			
	Standard concrete (mm) ^{iv}		20			

ⁱ structural mesh should be sized and designed according to BS EN 1990, BS 1991-1-1 and BS EN 1992-1-1;

ⁱⁱ except when installed over underfloor heating, when a minimum thickness above services of 75 mm must be maintained;

ⁱⁱⁱ the aggregate for concrete shall comply with BS EN 12620;

^{iv} the specification and workability of the concrete should be selected as appropriate for the intended installation method in accordance with BS 8500-1 and BS EN 206.

Table 3 - Permitted imposed and partition floor loads for concrete toppings reinforced with steel fibres, micro-polymer fibres, macro-polymer fibres and steel mesh

Description	Characteristic value of loads		
	Single-family dwellings ⁱ	Communal areas in blocks of flats ⁱ	Commercial buildings ⁱⁱ
Uniformly distributed load (UDL) q_k (kN/m ²)	1.5	3.0	5.0
Concentrated load Q_k (kN)	2.0	4.0	4.5
Allowance for moveable partitions (kN/m ²) when self-weight \leq 3.0 kN/m	1.0	1.0	1.0

ⁱ steel mesh A142 values determined from testing and calculation;

ⁱⁱ steel mesh sized and designed according to BS EN 1990, BS 1991-1-1 and BS EN 1992-1-1.

Note:

- imposed concentrated load must not be combined with imposed uniformly distributed load or other variable actions;
- imposed concentrated load for residential buildings is assumed to be applied over a square plate of area not less than 50 mm by 50 mm;
- do not combine distributed loads with point loads or with line loads (self-weight of partition walls);
- for line load partitions the required beam widths are as Figures 1 & 2 and Kiwa report 15-B-035.

2.1.13 Durability

The Systems will have a service life durability equivalent to that of the structure into which they are incorporated.

The EPS components in the Systems are protected from the majority of agents likely to cause deterioration and will remain effective as insulation for the life of the building. However, EPS components may deteriorate when subjected to volatile organic compounds (VOCs) or other gases, and where such conditions apply an assessment should be made by a suitably qualified person to determine the compatibility of the EPS components with any potential emissions.

Beneath a suspended ground floor over a ventilated void and soil, the exposure condition is class XC3 in accordance with BS EN 1992-1-1. The pre-stressed concrete beams will have adequate durability for this exposure.

2.1.14 CE Marking

The relevant harmonised European standards for the Systems are BS EN 15037-4 and BS EN 13163.

2.2 - EXAMPLES OF TYPICAL DETAILS

Figure 6 - Typical pre-stressed concrete beam profiles

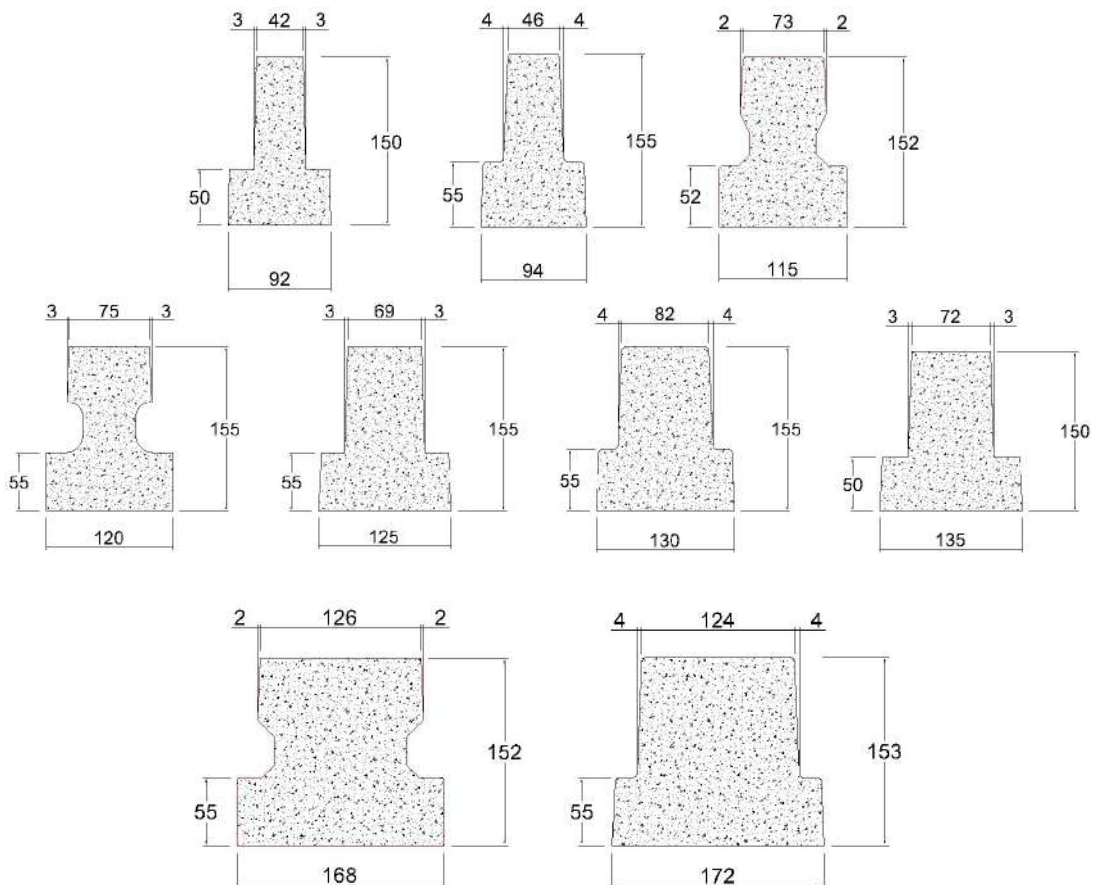

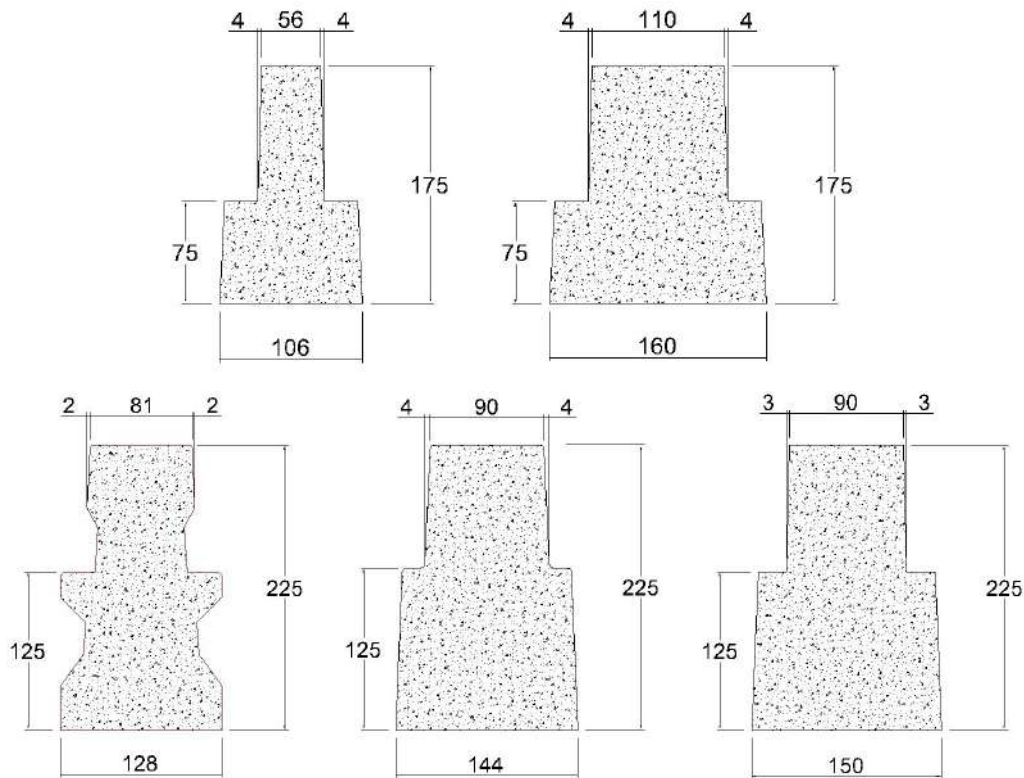

Figure 6 (continued) - Typical pre-stressed concrete beam profiles

2.3 - INSTALLATION

The Systems must be installed strictly in accordance with the instructions of the Agrément holder and the requirements of this Agrément.

2.3.1 Installer competence level

See section 2.1.6.

2.3.2 Delivery, storage and site handling

See section 2.1.7.

2.3.3 Project specific installation considerations

No pre-installation survey is required for the installation of the Systems.

2.3.4 Preparation

The following works must be undertaken prior to the installation of the Systems:

- the underfloor void must be a minimum of 150 mm. Where the substrate has high, medium or low clay heave potential, the void should be increased accordingly. See also NHBC Standards, Chapter 4.2;
- the ground level beneath the floor does not need to be raised to the external ground level where there are either land drains or good natural drainage;
- the surface base beneath the void should be free of topsoil and vegetation and laid level. Any material used to level the surface must be hard and dry. A concrete or other proprietary surface seal is not required;
- sufficient time should be allowed for the mortar in supporting substructure walls to reach its full design strength prior to the laying of the pre-stressed concrete beams, which should in turn be laid on a continuous damp-proof course in accordance with CP 102;
- underfloor ventilation must be provided to the subfloor void. Wall ties and concrete cavity fill should be incorporated in the substructure masonry to ensure structural integrity.

2.3.5 Outline installation procedure

The key sequence for installation is:

- always ensure that a minimum 150 mm ventilated airspace is provided beneath the lowest point in the floor, to allow air to circulate;
- pre-stressed concrete beams shall be laid out in accordance with the project specific design drawings;
- it is important that Beamshield Top Sheets are not installed with joints within any zone of structural loading or influence. These include (but are not limited to) directly over and parallel to the precast concrete beams, nor within 375 mm of the centreline of a partition spanning perpendicular to the beams;
- where it is necessary to cut Beamshield EPS units to 300 mm or less in length, the cut piece must be positioned at the edge of the floor. Precautions must be taken to ensure that these pieces are not damaged by site foot traffic;
- the Beamshield EPS units are to be cut as required to accommodate service penetrations and the resulting gaps should be filled with either expanding foam or other insulation to minimise local thermal bridging and air infiltration.

Beamshield Infill units

The following applies with specific regard to Beamshield Infill units:

- all Beamshield Infill units shall be installed from above;
- it is good practice to use the appropriate Beamshield Infill unit to measure the distances between beams;
- Beamshield Infill end units can be cut as required to start and end the sequence.

Beamshield Plus units

The following applies with specific regard to Beamshield Plus units:

- Beamshield Plus starter units are to be attached to the first beam and then positioned tightly against the wall;
- it is good practice to start each floor with a Beamshield Plus starter unit and proceed in the direction of the toe to the opposite wall;
- it must be ensured that the correct Beamshield Plus units are used with single beams and multiple beams. The vertical gap between the Beamshield Plus unit toe and the adjacent Beamshield Plus unit must not exceed 6 mm in order to prevent cold air passing through gaps in the Beamshield Plus units and reducing the thermal performance of the System.

2.3.6 Finishing

The following finishing is required upon completion of the installation:

- the Agrément holder can supply profiled Beamshield EPS end units for the project specific design. Alternatively, full or half Beamshield EPS units can be cut down on site to the required size ensuring that they are no more than 300 mm wide at the top;
- a gas barrier membrane can be installed where specified and laid in accordance with the membrane manufacturer's requirements;
- the Beamshield Top Sheet is laid over the precast concrete beams and Beamshield EPS units and cut with a handsaw to accommodate service penetrations and part sheet widths where necessary. Small offcuts can be used to seal around service penetrations.

Note: At this stage the floor is not suitable to be loaded or to support wheeled traffic/scaffold etc.

Beamshield UFH and Beamshield Plus UFH

If specified, underfloor heating pipes can be installed. These can be secured to the Beamshield Top Sheet using standard pipe clips. A minimum 75 mm thickness of structural concrete topping above the pipes must be maintained.

Structural concrete topping

Prior to the concrete pour, Perimeter Strips (30 mm thick white EPS or 25 mm thick Platinum EPS) must be installed against the exposed inner leaf of the perimeter wall.

The specified structural concrete topping shall be poured carefully and not dropped from a height greater than 500 mm, ensuring that heaping is kept to a height of not greater than 300 mm.

2.4 - INDEPENDENTLY ASSESSED SYSTEM CHARACTERISTICS

Table 5 - Beamshield Infill, Beamshield Plus and Beamshield VWB characteristics in accordance with BS EN 15037-4

Characteristic	Standard EPS	Platinum EPS	EPS 120	EPS 120E	Platinum EPS 120E	EPS 200
Component	Beamshield Infill/ Beamshield Plus	Beamshield Infill/ Beamshield Plus	Beamshield VWB	Beamshield VWB	Beamshield VWB	Beamshield VWB

2.5 - SYSTEM COMPONENTS AND ANCILLARY ITEMS

2.5.1 System components included within the scope of this Agrément

The following components are integral to the Systems:

Table 7 - System components

Component	Description	Dimensions
Beamshield Infill	comprising End units, Full units and Half units, in standard (white) or Platinum (grey) EPS manufactured to BS EN 15037-4	1200 mm long
Beamshield Plus	comprising Starter units, Full units, Half units and End units, in standard (white) or Platinum (grey) EPS manufactured to BS EN 15037-4	1200 mm long
Beamshield Top Sheets	in standard (white) or Platinum (grey) EPS manufactured to BS EN 13163	1200 mm wide by 2400 mm long
Beamshield VWB	in standard (white) or Platinum (grey) EPS manufactured to BS EN 15037-4	350 mm wide by 1200 mm long

Ancillary components integral to the Systems:

- Perimeter Strips - in standard (white) or Platinum (grey) EPS, 25 mm thick (grey) or 30 mm thick (white);
- concrete toppings - reinforced concrete toppings placed above beam and block systems. These are reinforced with either wire mesh, steel fibres, polymer macro-fibres or polymer micro-fibres and designed in accordance with BS EN 1990 and BS EN 1992-1-1 or TR34.

2.5.2 Ancillary items falling outside the scope of this Agrément

Ancillary items detailed in this section may be used in conjunction with the Systems but fall outside the scope of this Agrément:

- pre-stressed concrete beams - for transferring load to the supporting primary structure. The pre-stressed concrete beams must be CE marked, designed and manufactured to BS EN 15037-1. See also section 2.1.12.3;
- masonry closure and coursing blocks - used as an inner leaf of the wall;
- gas barrier membranes - for acting as a barrier for gas emissions;
- damp-proof course - for protection of the structure against water from the ground.

2.6 - TYPICAL INSTALLATION EXAMPLES

Figure 7 - Typical Beamshield Top Sheet floor/wall junction

Figure 8 - Typical Beamshield Plus Top Sheet floor/wall junction

Figure 9 - Typical Beamshield UFH floor/wall junction

Figure 10 - Typical Beamshield Plus UFH floor/wall junction

CHAPTER 3 - CDM, NATIONAL BUILDING REGULATIONS AND THIRD-PARTY ACCEPTANCE

3.1 - THE CONSTRUCTION (DESIGN AND MANAGEMENT) REGULATIONS 2015 AND THE CONSTRUCTION (DESIGN AND MANAGEMENT) REGULATIONS (NORTHERN IRELAND) 2016

Information in this Agrément may assist the client, Principal Designer/CDM co-ordinator, designer and contractors to address their obligations under these Regulations.

3.2 - THE NATIONAL BUILDING REGULATIONS

In the opinion of Kiwa Ltd., the Systems, if installed and used in accordance with Chapter 2 of this Agrément, can satisfy or contribute to satisfying the relevant requirements of the following national Building Regulations.

3.2.1 - ENGLAND THE BUILDING REGULATIONS 2010 AND SUBSEQUENT AMENDMENTS

- A1 Loading - the Systems can sustain and transmit dead and imposed floor loads to the ground.
- C2(c) Resistance to moisture - the EPS units and boards will contribute to limiting the risk of surface and interstitial condensation.
- L1(a)(i) Conservation of fuel and power - the EPS units and boards will contribute to satisfying this Requirement.
- Regulation 7 Materials and workmanship - the EPS units and boards are manufactured from suitably safe and durable materials for their application and can be installed to give a satisfactory performance.
- Regulation 26 - CO₂ emission rates for new buildings - the EPS units and boards will contribute to satisfying this Regulation.
- Regulation 26A - Fabric energy efficiency rates for new dwellings - the EPS units and boards will contribute to satisfying this Regulation.

3.2.2 - WALES THE BUILDING REGULATIONS 2010 AND SUBSEQUENT AMENDMENTS

- A1 Loading - the Systems can sustain and transmit dead and imposed floor loads to the ground.
- C2(c) Resistance to moisture - the EPS units and boards will contribute to limiting the risk of surface and interstitial condensation.
- L1(a)(i) Conservation of fuel and power - the EPS units and boards will contribute to satisfying this Requirement.
- Regulation 7 Materials and workmanship - the EPS units and boards are manufactured from suitably safe and durable materials for their application and can be installed to give a satisfactory performance.
- Regulation 26 - CO₂ emission rates for new buildings - the EPS units and boards will contribute to satisfying this Regulation.
- Regulation 26A - Primary energy consumption rates for new buildings - the EPS units and boards will contribute to satisfying this Regulation.
- Regulation 26B - Fabric performance values for new dwellings - the EPS units and boards will contribute to satisfying this Regulation.

3.2.3 - SCOTLAND THE BUILDING (SCOTLAND) REGULATIONS 2004 AND SUBSEQUENT AMENDMENTS

3.2.3.1 Regulations 8 (1)(2) Durability of materials and workmanship

- The EPS units and boards are manufactured from acceptable materials and are considered to be adequately resistant to deterioration and wear under normal service conditions, provided they are installed in accordance with the requirements of this Agrément.

3.2.3.2 Regulation 9 Building Standards - Construction

- 1.1(a)(b) Structure - the Systems can sustain and transmit dead and imposed floor loads to the ground.
- 3.15 Condensation - the EPS units and boards will contribute to limiting the risk of surface and interstitial condensation.
- 6 Energy - the EPS units and boards will contribute to satisfying the requirements of 6.1(b) - Carbon dioxide emissions, and 6.2 - Building insulation envelope.
- 7.1(a)(b) Statement of sustainability - the EPS units and boards can contribute to satisfying the relevant Requirements of Regulation 9, Standards 1 to 6, and therefore will contribute to a construction meeting a bronze level of sustainability as defined in this Standard. In addition, the EPS units and boards can contribute to a construction meeting a higher level of sustainability as defined in this Standard.

3.2.3.3 Regulation 12 Building Standards - Conversions

- All comments given under Regulation 9 also apply to this Regulation, with reference to Schedule 6 of The Building (Scotland) Regulations 2004 and subsequent amendments, and clause 0.12 of the Technical Handbook (Domestic).

3.2.4 - NORTHERN IRELAND THE BUILDING REGULATIONS (NORTHERN IRELAND) 2012 AND SUBSEQUENT AMENDMENTS

- 23(a)(i)(iii)(b) Fitness of materials and workmanship - the EPS units and boards are manufactured from materials which are considered to be suitably safe and acceptable for use as thermal insulation.
- 28 Resistance to moisture and weather - the Systems can be constructed so as to prevent any harmful effect on the building or the health of the occupants caused by the passage of moisture to any part of the building from (a) the ground and (b) the weather.
- 29 Condensation - the EPS units and boards will contribute to limiting the risk of surface and interstitial condensation.
- 30 Stability - when installed and used in accordance with this Agrément, the Systems can sustain and transmit dead and imposed floor loads to the ground.
- The EPS units and boards will contribute to satisfying the requirements of 39(a)(i) - Conservation measures, and 40(2) - Target carbon dioxide emission rate.

3.3 - THIRD-PARTY ACCEPTANCE

NHBC - In the opinion of Kiwa Ltd., the Systems, if installed, used and maintained in accordance with this Agrément, can satisfy or contribute to satisfying the relevant requirements in relation to NHBC Standards, Chapter 5.2.

CHAPTER 4 - SOURCES

- BS EN ISO 10211:2017 Thermal bridges in building constructions. Calculation of heat flows and surface temperatures
- BS EN ISO 13370:2017 Thermal performance of buildings. Heat transfer via the ground. Calculation methods
